Types of Data Science Questions

In approximate order of difficulty

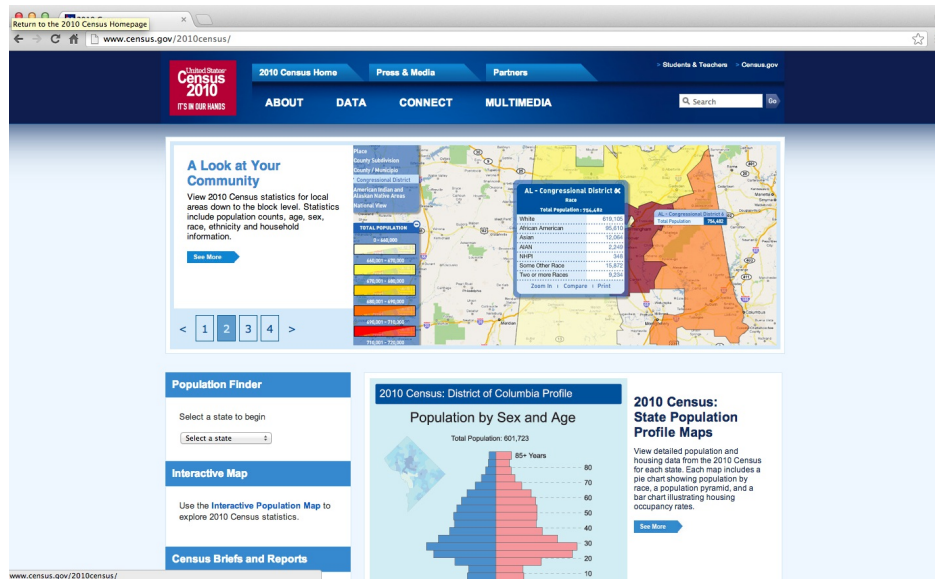

- Descriptive
- Exploratory
- Inferential
- Predictive
- Causal
- Mechanistic

About descriptive analyses

Goal: Describe a set of data

- The first kind of data analysis performed
- Commonly applied to census data
- The description and interpretation are different steps
- Descriptions can usually not be generalized without additional statistical modeling
so just describing, not interpreting meaning from description

Descriptive analysis

<http://www.census.gov/2010census/>

Descriptive analysis

<http://books.google.com/ngrams>

About exploratory analysis

Goal: Find relationships you didn't know about

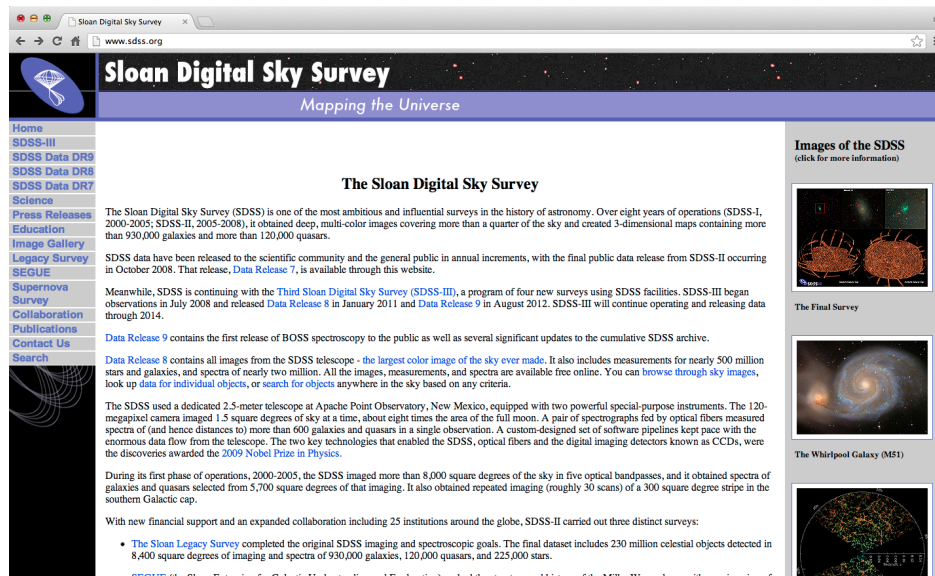

- Exploratory models are good for discovering new connections
- They are also useful for defining future studies
- Exploratory analyses are usually not the final say
- Exploratory analyses alone should not be used for generalizing/predicting just finding relationships btw variables
- Correlation does not imply causation

Exploratory analysis

Exploratory analysis

The screenshot shows the Sloan Digital Sky Survey (SDSS) website. The browser address bar displays "www.sdss.org". The website header features the SDSS logo and the tagline "Mapping the Universe". A left-hand navigation menu lists various sections: Home, SDSS-III, SDSS Data DR9, SDSS Data DR8, SDSS Data DR7, Science, Press Releases, Education, Image Gallery, Legacy Survey, SEGUE, Supernova Survey, Collaboration, Publications, Contact Us, and Search. The main content area is titled "The Sloan Digital Sky Survey" and contains several paragraphs of text describing the survey's history, data releases, and scientific goals. It mentions that SDSS is one of the most ambitious surveys in astronomy, having obtained deep, multi-color images covering more than a quarter of the sky. It also notes that SDSS-III will continue operating and releasing data through 2014. On the right side, there is a section titled "Images of the SDSS" with a link to "click for more information". Below this, there are three image thumbnails: "The Final Survey" showing a spiral galaxy, "The Whirlpool Galaxy (M51)" showing a face-on spiral galaxy, and a third image showing a dense field of stars and galaxies.

Sloan Digital Sky Survey
Mapping the Universe

The Sloan Digital Sky Survey

The Sloan Digital Sky Survey (SDSS) is one of the most ambitious and influential surveys in the history of astronomy. Over eight years of operations (SDSS-I, 2000-2005; SDSS-II, 2005-2008), it obtained deep, multi-color images covering more than a quarter of the sky and created 3-dimensional maps containing more than 930,000 galaxies and more than 120,000 quasars.

SDSS data have been released to the scientific community and the general public in annual increments, with the final public data release from SDSS-II occurring in October 2008. That release, [Data Release 7](#), is available through this website.

Meanwhile, SDSS is continuing with the [Third Sloan Digital Sky Survey \(SDSS-III\)](#), a program of four new surveys using SDSS facilities. SDSS-III began observations in July 2008 and released [Data Release 8](#) in January 2011 and [Data Release 9](#) in August 2012. SDSS-III will continue operating and releasing data through 2014.

[Data Release 9](#) contains the first release of BOSS spectroscopy to the public as well as several significant updates to the cumulative SDSS archive.

[Data Release 8](#) contains all images from the SDSS telescope - [the largest color image of the sky ever made](#). It also includes measurements for nearly 500 million stars and galaxies, and spectra of nearly two million. All the images, measurements, and spectra are available free online. You can [browse through sky images](#), look up [data for individual objects](#), or [search for objects](#) anywhere in the sky based on any criteria.

The SDSS used a dedicated 2.5-meter telescope at Apache Point Observatory, New Mexico, equipped with two powerful special-purpose instruments. The 120-megapixel camera imaged 1.5 square degrees of sky at a time, about eight times the area of the full moon. A pair of spectrographs fed by optical fibers measured spectra of (and hence distances to) more than 600 galaxies and quasars in a single observation. A custom-designed set of software pipelines kept pace with the enormous data flow from the telescope. The two key technologies that enabled the SDSS, optical fibers and the digital imaging detectors known as CCDs, were the discoveries awarded the [2009 Nobel Prize in Physics](#).

During its first phase of operations, 2000-2005, the SDSS imaged more than 8,000 square degrees of the sky in five optical bandpasses, and it obtained spectra of galaxies and quasars selected from 3,700 square degrees of that imaging. It also obtained repeated imaging (roughly 30 scans) of a 300 square degree stripe in the southern Galactic cap.

With new financial support and an expanded collaboration including 25 institutions around the globe, SDSS-II carried out three distinct surveys:

- [The Sloan Legacy Survey](#) completed the original SDSS imaging and spectroscopic goals. The final dataset includes 230 million celestial objects detected in 8,400 square degrees of imaging and spectra of 930,000 galaxies, 120,000 quasars, and 225,000 stars.
- [SEGUE](#) (the Sloan Extension for Galactic Understanding and Exploration) probed the structure and history of the Milky Way galaxy with new images of

About inferential analysis

Goal: Use a relatively small sample of data to say something about a bigger population part for a whole

- Inference is commonly the goal of statistical models
- Inference involves estimating both the quantity you care about and your uncertainty about your estimate
- Inference depends heavily on both the population and the sampling scheme

Inferential analysis

About predictive analysis

Goal: To use the data on some objects to predict values for another object what does one say about the other

- If X predicts Y it does not mean that X causes Y
- Accurate prediction depends heavily on measuring the right variables
- Although there are better and worse prediction models, more data and a simple model [works really well](#)
- Prediction is very hard, especially about the future [references](#)

Predictive analysis

Predictive analysis

The screenshot shows a web browser displaying a Forbes article. The browser's address bar shows the URL: www.forbes.com/sites/kashmirhill/2012/02/16/how-target-figured-out-a-teen-girl-was-pregnant-before-her-father-did/. The Forbes header includes navigation links like 'New Posts', 'Most Popular', 'Lists', and 'Video'. The article is by Kashmir Hill, a Forbes Staff member. The title is 'How Target Figured Out A Teen Girl Was Pregnant Before Her Father Did'. The article text begins with 'Every time you go shopping, you share intimate details about your consumption patterns with retailers. And many of those retailers are studying those details to figure out what you like, what you need, and which coupons are most likely to make you happy. Target, for example, has figured out how to data-mine its way into your womb, to figure out whether you have a baby on the way long before you need to start buying diapers.' To the right of the text is a large red Target bullseye logo. On the left side of the article, there are social media sharing buttons for Facebook, Twitter, LinkedIn, and Reddit, along with a 'Submit' button. A sidebar on the right contains a link: 'Click here to see how Covidien is making a difference >'. The bottom of the page shows the Covidien logo.

How Target Figured Out A Teen Girl Was Pregnant Before Her Father Did

307 comments, 167 called-out [+ Comment Now](#) [+ Follow Comments](#)

Every time you go shopping, you share intimate details about your consumption patterns with retailers. And many of those retailers are studying those details to figure out what you like, what you need, and which coupons are most likely to make you happy. Target, for example, has figured out how to data-mine its way into your womb, to figure out whether you have a baby on the way long before you need to start buying diapers.

About causal analysis

Goal: To find out what happens to one variable when you make another variable change.

- Usually randomized studies are required to identify causation
- There are approaches to inferring causation in non-randomized studies, but they are complicated and sensitive to assumptions
- Causal relationships are usually identified as average effects, but may not apply to every individual
- Causal models are usually the "gold standard" for data analysis

AbstractArticleReferencesComments

BACKGROUND

Recurrent *Clostridium difficile* infection is difficult to treat, and failure rates for antibiotic therapy are high. We studied the effect of duodenal infusion of donor feces in patients with recurrent *C. difficile* infection.

About mechanistic analysis

Goal: Understand the exact changes in variables that lead to changes in other variables for individual objects.

- Incredibly hard to infer, except in simple situations
- Usually modeled by a deterministic set of equations (physical/engineering science)
- Generally the random component of the data is measurement error
- If the equations are known but the parameters are not, they may be inferred with data analysis

Mechanistic analysis

Mechanistic - Empirical Pavement Design

Problem: Empirical Design Process Restrict Performance Prediction

Accurately predicting performance and durability is critical to improving the design of new and existing pavements. Poor performance increases traffic congestion, compromises public safety, and raises maintenance costs due to frequent repairs. Each year, transportation agencies spend more than \$20 billion in Federal funds to improve the Nation's pavements. Existing design procedures are based upon the 1950's AASHTO Road Test and use empirical relationships. Presently, pavement designs often exceed the data limits and conditions used in the AASHTO Road Test have been exceeded. Pavement with expected traffic as much as 30 times greater are

Deployment Process:

The Federal Highway Administration (FHWA) organized the Design Guide Implementation Team (DGIT) to inform the FHWA division offices, State highway agencies, industry members, and other organizations and experts about the upcoming guide and to help potential users prepare for it. To introduce the guide and to discuss implementation issues, the DGIT has developed a one-day workshop. Seven of these workshops will be held across the Nation, starting on May 25, 2004, in Biloxi, MS. Other workshops will be held in Vancouver, WA (June); Indianapolis, IN (July); Hawaii (July); Mystic, CT (August); Kansas City, KS (September); and Phoenix, AZ (October).
